2.2 Font—Changing Face and Size

There are even more ways in which we can change fonts:

Fonts to use (font face) : comic sans ms

harrington

lucida calligraphy

times new roman

<FONT FACE="harrington"> Harrington will show</FONT>

Changing the size of fonts

There are different ways to tell the computer to use different font sizes

We will use numbers 1 2 3 4 5 6 7

<FONT SIZE="3">some writing</FONT>

Using both together:

<FONT FACE="harrington" SIZE="3"> something</FONT>

REMEMBER:

1. EVERY time you want a different font, you need to open a font tag and then close it again at the end.
2. Put each tag on a new line so that it is easier for us to follow our own coding and find any mistakes that we might make.
3. Your computer can only interpret and use fonts that have already been loaded on it, so you could easily do something at school, but when you look at it somewhere else, it looks different.
4. "Times New Roman" is the default (in other words, the computer will choose this one if it does not have the one you chose … or if you made ANY coding or spelling error
5. In addition to tags< > </ > you will also need to use quotations " "

<HTML> <BODY>	
<FONT FACE="???????" SIZE="?">	Opening font tag
The writing that you want	Something you want to write
</FONT>	Closing font tag
</BODY> </HTML>	

NOW YOU TRY:

OPEN Notepad, and make an HTML document.

USE the font tag to change the FACE and SIZE of your font

REMEMBER: To use all tags in pairs

VIEW it in your browser.
